

# Analytics Trust Ledger

CharmLink Reporting Note

Version 1.0 — 4 September 2026

Applies to: CharmLink admin dashboard and OnlyFans tracking links

Three separate faults in our analytics were found and fixed this week. Each one changes how the dashboard reads, and two of them produced numbers that were confidently wrong rather than obviously broken.

This note records which figures can be trusted, which should be ignored, and the three dates that account for every apparent jump in the graphs. It is written to be read before the next weekly review.

## Contents

1. If you read nothing else
2. The trust ledger
3. Three dates that explain the graphs
4. The one real decline
5. Traps worth knowing about
6. Standing rules

---

## 1. If you read nothing else

- **Big swings in the dashboard this week are mostly the meter being fixed, not the business changing.** Reported views fell and CTR roughly tripled on the same day, because we stopped counting some visitors twice.
- **The three auto-redirect domains were never broken. The counter was.** They reported zero for their entire life while OnlyFans recorded 152 clicks against those same links in a single week.
- **One decline is real: fav-site.com is down about a third,** confirmed independently by OnlyFans' own figures. That one is not a tracking artifact.
- **For anything about revenue, OnlyFans is the source of truth.** Our numbers count arrivals at our page; theirs count landings on the offer. The two will not match, and that is correct.

NOTE — The single habit that would have caught this week's largest error: before calling a domain dead, check OnlyFans for the same tracking link. Our dashboard said zero; OnlyFans said 152 clicks.

---

## 2. The trust ledger

What each dashboard figure is worth, and from when. Anything marked **TRUST AFTER** is sound going forward but must not be compared against dates before the one shown.

| Metric                   | Status             | Reliable from | Why                                                                                        |
|--------------------------|--------------------|---------------|--------------------------------------------------------------------------------------------|
| OnlyFans clicks and subs | <b>TRUST</b>       | Always        | Recorded by OnlyFans, independent of our code. The reference for anything revenue-related. |
| Premium clicks           | <b>TRUST</b>       | Always        | Never affected by the double-count. Safe to compare across any period.                     |
| Instagram traffic        | <b>TRUST</b>       | Always        | Counted once per visit throughout.                                                         |
| Page views               | <b>TRUST AFTER</b> | 30 Aug 2026   | Earlier figures are inflated on Instagram-heavy domains: one visitor was counted as two.   |
| CTR                      | <b>TRUST AFTER</b> | 30 Aug 2026   | Built on page views, so it read artificially low before the fix.                           |
| Photo performance        | <b>TRUST AFTER</b> | 30 Aug 2026   | Earlier results credited the wrong photo and cannot be recovered.                          |
| Auto-redirect arrivals   | <b>TRUST AFTER</b> | 4 Sep 2026    | Nothing at all was recorded before 3 Sep. There is no history to compare against.          |

| Metric          | Status        | Reliable from | Why                                                                                                                                         |
|-----------------|---------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Escape failures | <b>IGNORE</b> | n/a           | Measures how long someone took to tap a dialog, not whether they got stuck. Half of the sessions it flagged as failures went on to convert. |
| Top referrers   | <b>IGNORE</b> | n/a           | Known fault: the panel reports each domain against itself. It is not telling you where traffic came from.                                   |

### 3. Three dates that explain the graphs

Any sharp step in this week's charts traces back to one of these three dates.

#### 30 Aug Views fell, CTR tripled, nothing actually changed

When an Instagram visitor was bounced out to Safari, the second page load was counted as a second person. Removing that double-count cut reported views roughly in half on Instagram-heavy domains, and moved CTR from about 23 per cent to about 72 per cent overnight.

**Read it as:** the denominator became honest. Traffic did not collapse and conversion did not triple. Do not compare views or CTR across this date.

#### 3 Sep Auto-redirect domains start existing in the data

Every visit to message-hanna.com, tap-dat.com and c-lickit.com was being rejected by the database and silently discarded. The dashboard showed zero, which read as three dead domains, while OnlyFans recorded 152 clicks and 2 subscribers against those same links over seven days.

**Read it as:** a counter switching on. Growth on these domains in early September is not new traffic. Everything before 3 September is unrecoverable.

#### 4 Sep Redirect arrivals become near-complete

Redirect pages hand the visitor to another app almost immediately, which could kill the tracking signal before it was sent. A signal that never arrives looks exactly like a visitor who never came. The server now records the arrival itself, so it no longer depends on the visitor's phone cooperating.

**Read it as:** a modest step up in reported arrivals on those three domains around 4 September, reflecting better capture rather than more people.

### 4. The one real decline

Comparing the seven days to 2 September against the seven before it, measured in OnlyFans' own figures rather than ours:

|             | fav-site.com | Whole account |
|-------------|--------------|---------------|
| Clicks      | -33%         | -7%           |
| Subscribers | -38%         | -2%           |

Our own tracking shows the same magnitude independently, which is what rules out a measurement fault. The page itself is healthy: it loads correctly, serves the right links, and no filter is turning away legitimate visitors. This was verified directly against the live site.

The account overall is close to flat, so this is one domain losing ground rather than a business-wide drop. **The most likely cause sits upstream on Instagram** — fewer people reaching or tapping that specific link — rather than anything in our own stack.

**WARNING** — This is the one figure in this note that warrants a business decision rather than reassurance. Recommend watching it for another week before acting, since a single week is short for a domain whose traffic already moves around.

---

## 5. Traps worth knowing about

### Never total OnlyFans figures by campaign code

Campaign codes repeat across her two OnlyFans accounts. Code 1079 exists on both: one carries 62 clicks, the other 315. Adding by code silently merges two unrelated links into one wrong number. Always match on the full tracking URL instead.

### Our counts will sit below OnlyFans on redirect domains

We count someone arriving at our page. OnlyFans counts them landing on the offer. Those are different points in the same funnel, so a gap between the two is expected and healthy. Use ours for traffic direction and theirs for conversion, and do not treat the difference as lost data.

### A zero has meant two different things

Every fault found this week presented as a zero, and a zero produced by a broken counter is indistinguishable from genuine silence. That ambiguity is what produced the conclusion that three healthy domains were dead.

Guardrails now exist for exactly this: failed writes are recorded rather than discarded, and an automated check fails the build if the system tries to record something the database would reject. That check would have caught the auto-redirect fault on the day the feature shipped.

---

## 6. Standing rules

How to read the dashboard from here.

| # | Rule                                                                                                           |
|---|----------------------------------------------------------------------------------------------------------------|
| 1 | Do not compare views or CTR across 30 August. Clicks are safe to compare across any date.                      |
| 2 | Treat the auto-redirect domains as having no history before 4 September.                                       |
| 3 | For anything about revenue, quote OnlyFans, matched on the full tracking URL.                                  |
| 4 | Ignore the escape-failure and top-referrer panels entirely until they are rebuilt.                             |
| 5 | Before calling a domain dead, check OnlyFans for the same link.                                                |
| 6 | The escape-versus-stay experiment is switched off. No test is running, and no result should be quoted from it. |

*Figures verified against production data and OnlyFans tracking on 4 September 2026. Questions on any single number should go to engineering with the domain and date range attached.*
