

Analytics Trust Ledger

CharmLink Reporting Note

Version 1.3 — 22 September 2026

Applies to: CharmLink admin dashboard and OnlyFans tracking links

Six separate faults in our analytics were found and fixed over the past three weeks. Each one changes how the dashboard reads, and five of them produced numbers that were confidently wrong rather than obviously broken.

This note records which figures can be trusted, which should be ignored, and the six dates that account for every apparent jump in the graphs. It is written to be read before the next weekly review.

Contents

1. If you read nothing else
2. The trust ledger
3. Six dates that explain the graphs
4. The one real decline
5. Traps worth knowing about
6. Standing rules

1. If you read nothing else

- **Big swings in the dashboard this week are mostly the meter being fixed, not the business changing.** Reported views fell and CTR roughly tripled on the same day, because we stopped counting some visitors twice.
- **The three auto-redirect domains were never broken. The counter was** — twice. First it reported zero for their entire life while OnlyFans recorded 152 clicks against those same links in a week. Then, once switched on, it counted about five visitors for every real one.
- **The Instagram-to-OnlyFans handoff is close to lossless.** Measured over 5-9 September with the automated traffic removed: 167 real arrivals produced 151 OnlyFans clicks, roughly 90 per cent. About 4 per cent of those clicks became subscribers.
- **One decline is real: fav-site.com is down about a third**, confirmed independently by OnlyFans' own figures. That one is not a tracking artifact.
- **For anything about revenue, OnlyFans is the source of truth.** Our numbers count arrivals at our page; theirs count landings on the offer. The two will not match, and that is correct.

NOTE — The single habit that would have caught this week's largest error: before calling a domain dead, check OnlyFans for the same tracking link. Our dashboard said zero; OnlyFans said 152 clicks.

2. The trust ledger

What each dashboard figure is worth, and from when. Anything marked **TRUST AFTER** is sound going forward but must not be compared against dates before the one shown.

Metric	Status	Reliable from	Why
OnlyFans clicks and subs	TRUST	Always	Recorded by OnlyFans, independent of our code. The reference for anything revenue-related.
Premium clicks	TRUST	Always	Never affected by the double-count. Safe to compare across any period. Four domains were under-reported until 18 Sep because their traffic was filed under an old name; that history has been restored and the corrected figures now apply to the past too.
Instagram traffic	TRUST	Always	Counted once per visit throughout.
Page views	TRUST AFTER	30 Aug 2026	Earlier figures are inflated on Instagram-heavy domains: one visitor was counted as two.

Metric	Status	Reliable from	Why
CTR	TRUST AFTER	30 Aug 2026	Built on page views, so it read artificially low before the fix.
Photo performance	TRUST AFTER	30 Aug 2026	Earlier results credited the wrong photo and cannot be recovered.
Sent to OnlyFans (headline)	TRUST AFTER	22 Sep 2026	Counts taps AND redirect arrivals. Before this date the headline counted taps only, so any creator with redirect domains was understated — Hanna by 2.3x on 22 Sep.
Auto-redirect arrivals	TRUST AFTER	9 Sep 2026	Nothing was recorded before 3 Sep, and from 3-9 Sep the figure counted roughly five visitors for every real one: 81% of it was automated traffic that our filters did not recognise. Corrected on 9 Sep, and the history was corrected with it.
Escape failures	IGNORE	n/a	Measures how long someone took to tap a dialog, not whether they got stuck. Half of the sessions it flagged as failures went on to convert.
Top referrers	IGNORE	n/a	Known fault: the panel reports each domain against itself. It is not telling you where traffic came from.

3. Six dates that explain the graphs

Any sharp step in the charts traces back to one of these six dates.

30 Aug Views fell, CTR tripled, nothing actually changed

When an Instagram visitor was bounced out to Safari, the second page load was counted as a second person. Removing that double-count cut reported views roughly in half on Instagram-heavy domains, and moved CTR from about 23 per cent to about 72 per cent overnight.

Read it as: the denominator became honest. Traffic did not collapse and conversion did not triple. Do not compare views or CTR across this date.

3 Sep Auto-redirect domains start existing in the data

Every visit to message-hanna.com, tap-dat.com and c-lickit.com was being rejected by the database and silently discarded. The dashboard showed zero, which read as three dead domains, while OnlyFans recorded 152 clicks and 2 subscribers against those same links over seven days.

Read it as: a counter switching on. Growth on these domains in early September is not new traffic. Everything before 3 September is unrecoverable.

4 Sep Redirect arrivals become near-complete

Redirect pages hand the visitor to another app almost immediately, which could kill the tracking signal before it was sent. A signal that never arrives looks exactly like a visitor who never came. The server now records the arrival itself, so it no longer depends on the visitor's phone cooperating.

Read it as: a modest step up in reported arrivals on those three domains around 4 September, reflecting better capture rather than more people.

9 Sep Redirect arrivals stop counting robots as people

With arrivals finally recording, the number turned out to be roughly five times too high. 81 per cent of it was automated: traffic claiming to be desktop computers on domains that only ever receive Instagram taps, plus several hundred hits all sharing one iPhone software version from 2019. Our filters had classified every one of them as a person.

This mattered beyond the headline count. Taken at face value it made the handoff to OnlyFans look like 34 per cent — as though two thirds of visitors were being lost on the way. With the robots removed it is about 90 per cent.

Read it as: arrivals on these three domains drop sharply on 9 September and the earlier figures were corrected to match, so the history is comparable. Nothing about the real audience changed.

18 Sep Four domains get their missing history back

Traffic was filed under each site's short name, which is editable. Rename the name and the site kept working while its entire past quietly detached from it. Traffic is now filed under a permanent internal id instead, and the stranded history has been reattached.

The largest case had been wrong since June. `bouncedat.club` was reporting 502 views and 334 premium clicks against a true 1,347 and 713 — less than half its real performance, for a whole quarter, because it had been renamed. Three other domains move by one or two visits.

It could also credit the wrong person. One site's first two visits had been showing under a different creator entirely, because she was later given the name the first site used to have.

Read it as: unlike the other four dates, this one corrects the past rather than dividing it. The figures for earlier periods have changed, and the new ones are right. `bouncedat.club` rising 168 per cent on 18 September is recovery of traffic it always had, not new traffic.

22 Sep The headline figure starts counting the redirect domains

The main number counted taps on a landing page and nothing else. The redirect domains have no page to tap — they send the visitor straight to OnlyFans — so everyone they sent was missing from it, and those domains read as contributing nothing at all.

On the day this was found, Hanna's landing pages took 172 taps while her redirect domains sent a further 224 people. The real figure was 396 and the dashboard was showing 172. tap-dat.com by itself sent 207 people that day, more than all her landing pages combined, and displayed as zero.

The headline is now **Sent to OnlyFans** and counts both routes, with the split shown underneath. CTR deliberately still counts taps only, because the redirect domains have no page views to measure a rate against, and it now says so on the card.

Read it as: the number got wider, not the traffic. Expect a step up on 22 September of roughly a fifth account-wide, and far more than that for anyone running redirect domains. Nothing about the audience changed.

Found by Kayla, from the outside, in a day — after it had been wrong since 4 September.

4. The one real decline

Comparing the seven days to 2 September against the seven before it, measured in OnlyFans' own figures rather than ours:

	fav-site.com	Whole account
Clicks	-33%	-7%
Subscribers	-38%	-2%

Our own tracking shows the same magnitude independently, which is what rules out a measurement fault. The page itself is healthy: it loads correctly, serves the right links, and no filter is turning away legitimate visitors. This was verified directly against the live site.

The account overall is close to flat, so this is one domain losing ground rather than a business-wide drop.

The most likely cause sits upstream on Instagram — fewer people reaching or tapping that specific link — rather than anything in our own stack.

WARNING — This is the one figure in this note that warrants a business decision rather than reassurance. Recommend watching it for another week before acting, since a single week is short for a domain whose traffic already moves around.

5. Traps worth knowing about

Never total OnlyFans figures by campaign code

Campaign codes repeat across her two OnlyFans accounts. Code 1079 exists on both: on one account it is a link carrying 321 clicks and 71 subscribers, on the other it is tap-dat.com, carrying 146 clicks and no subscribers at all. Adding by code merges two unrelated links into one wrong number — in this case it would report tap-dat.com converting at 15 per cent when its true figure is zero. Always match on the full tracking URL instead.

Our counts should sit slightly ABOVE OnlyFans on redirect domains

We count someone arriving at our page. OnlyFans counts them a moment later, landing on the offer. Arriving comes first, so our number is the larger one and the small gap between them is people who left mid-handoff.

Measured 5-9 September: 167 human arrivals against 151 OnlyFans clicks, a handoff of about 90 per cent. **If our number ever drops below OnlyFans', that is a counting fault, not a funnel that improved.** Use ours for traffic direction and theirs for conversion.

A zero has meant two different things

Every fault found this week presented as a zero, and a zero produced by a broken counter is indistinguishable from genuine silence. That ambiguity is what produced the conclusion that three healthy domains were dead.

Guardrails now exist for exactly this: failed writes are recorded rather than discarded, and an automated check fails the build if the system tries to record something the database would reject. That check would have caught the auto-redirect fault on the day the feature shipped.

6. Standing rules

How to read the dashboard from here.

#	Rule
1	Do not compare views or CTR across 30 August. Clicks are safe to compare across any date.
2	Treat the auto-redirect domains as having no history before 4 September, and treat their arrival counts before 9 September as roughly five times too high.
3	For anything about revenue, quote OnlyFans, matched on the full tracking URL.
4	Ignore the escape-failure and top-referrer panels entirely until they are rebuilt.

#	Rule
5	Before calling a domain dead, check OnlyFans for the same link.
6	The escape-versus-stay experiment is switched off. No test is running, and no result should be quoted from it.
7	A sudden jump in traffic with no matching movement in OnlyFans clicks is robots until proven otherwise. Real visitors move both numbers.
8	Renaming a creator's short name no longer loses her traffic history, but it still breaks any link that uses it. Change it only when the custom domain is what people actually visit.
9	The headline counts both routes to the offer; CTR counts taps only. If a number looks too low for a creator running redirect domains, check which of the two you are reading.

Figures verified against production data and OnlyFans tracking on 22 September 2026. Questions on any single number should go to engineering with the domain and date range attached.
