

Auto-Redirect Links

CharmLink Standard Operating Procedure

Version 1.0 — 1 September 2026

Applies to: CharmLink admin at **/admin**

An **auto-redirect** site has no landing page. A visitor who opens the domain is sent straight to one OnlyFans link, escaping the Instagram in-app browser on the way. There is nothing to read and nothing to tap.

This is a different product from a normal CharmLink page, and it carries a different risk. Read Section 1 before creating one.

1. Before you start — the one rule that matters

STOP — Only ever put an auto-redirect on a throwaway domain. Never on a domain that is already earning.

A normal CharmLink page looks like a link-in-bio page. A page that instantly forwards to OnlyFans is far easier for Instagram to detect and ban, because there is nothing else on it.

CharmLink does protect these domains: crawlers are served a decoy blog instead of the real page, so an automated check sees an article about hiking rather than a redirect. That protection is real and switched on by default. It is not a guarantee.

So assume any auto-redirect domain **may eventually be burned**, and make sure that when it is, nothing valuable burns with it. Because one domain is one site in CharmLink, a banned auto-redirect domain takes down only itself — provided you did not put it on a domain that was already working.

NOTE — Rule of thumb: if losing this domain tomorrow would cost you money, it is the wrong domain for an auto-redirect.

2. What you need in hand

What	Why	Where it comes from
A spare domain	The one that may get burned. Must not be an earning domain.	Registrar, then add to Cloudflare
The domain on Cloudflare	Its nameservers must already point at Cloudflare before CharmLink can provision it.	Cloudflare dashboard
A fresh OnlyFans tracking link	So this domain's clicks and subscribers are counted separately from everything else.	OnlyFans / Infloww
The creator's name in CharmLink	The new domain is attached to an existing person, not created as a new one.	Admin → Creators

WARNING — Use a tracking code that is not used anywhere else. If you reuse an existing code, its numbers mix with the other pages and you will not be able to tell whether the auto-redirect actually performed better.

3. Step-by-step: creating an auto-redirect link

Step 1. Register the domain with CharmLink

Go to **Admin** → **Domains**. Under **Add Custom Domain**, enter the domain and submit. This registers it with the hosting and sets up Cloudflare automatically. If the row shows **SSL broken**, press the **Heal** button on that row and wait — this is normal for a brand new domain and usually clears within a few minutes.

Step 2. Add the domain to the right person

Go to **Admin** → **Creators** and open the creator, then open her **Person** settings. In the **Sites** card at the bottom, use **Add another domain**: enter a **slug** (a short internal name, lowercase, no spaces — e.g. reynaxo) and the **domain** you just registered. Press **Add domain**.

WARNING — Add the domain from the **person's** page, not with the **Add Creator** button on the Creators page. Add Creator makes a site that belongs to nobody, and a site belonging to nobody does not appear in the Creators list at all — it goes live and becomes invisible.

Step 3. Add the OnlyFans link

You are now on the new site's page. In the right-hand column find **Add Link**. Set **Label** to something meaningful for you (it is never shown to visitors on an auto-redirect site), paste the fresh OnlyFans tracking URL, and set **Type** to **Premium**. Save the link.

Step 4. Switch on the auto-redirect

On the same page, find the **Auto-redirect** card. Open the dropdown — it starts on **Off — normal landing page** — and choose the link you just added. Then press the page's **Save** button. The card shows a pink **ON** badge once active.

Step 5. Leave bot cloaking alone

Directly above is the **Bot cloaking** card. It is on by default and must stay on. It is what serves crawlers the decoy blog instead of your redirect. Only turn it off if an engineer tells you to.

NOTE — Only **active premium** links can be chosen as the target. If the dropdown is empty, go back to Step 3 — the link is missing, inactive, or was saved as Social instead of Premium.

4. Verifying it works

Do all three checks. They fail in different ways.

Check	How	Expected
It redirects	Open the domain on your phone, in a normal browser.	You land on the OnlyFans page almost immediately.
It escapes Instagram	Send yourself the domain in an Instagram DM and tap it from inside Instagram.	It opens in your normal browser (Safari/Chrome), not inside Instagram. You may see an <i>Open in app?</i> prompt first — that is the phone asking, and it is expected.
It is counted	Admin → Analytics, pick the creator, then that domain's tab.	Your visit appears. Note the domain shows no CTR — see below.

NOTE — An auto-redirect site deliberately records no page views and no clicks, because there is no page and nothing to tap. Its CTR will be blank, and that is correct — it is not broken. Judge these domains by their OnlyFans numbers instead: clicks and subscribers on the tracking code you gave it.

WARNING — OnlyFans figures are not live. They refresh roughly once a day, overnight. Do not judge a new domain the same day you create it.

5. Turning it off

Open the site, set the **Auto-redirect** dropdown back to **Off — normal landing page**, and Save. The domain immediately goes back to being an ordinary CharmLink page. Nothing is deleted and the links stay where they are.

Deleting or deactivating the target link has the same effect automatically: the site falls back to a normal landing page rather than breaking.

6. Troubleshooting

Symptom	Most likely cause	Fix
The new domain is nowhere in the Creators list	It was created with Add Creator instead of from the person, so it belongs to nobody and is filtered out of the list.	Open it from Admin → Analytics (it still appears there), then set Person on its page and Save.
Auto-redirect dropdown is empty	No active Premium link on this site.	Add one (Step 3). Check it is Premium, not Social, and is active.
Domain shows SSL broken	Certificate not issued yet — normal on a new domain.	Press Heal on that row in Admin → Domains, wait a few minutes, re-check.
Opens inside Instagram, not the browser	The escape does not succeed every time; roughly a quarter of attempts fail. This is a known limit, not a misconfiguration.	Nothing to fix. The visitor still reaches OnlyFans, just inside Instagram.
Page shows “Just a moment...” and stops	The visitor escaped to their browser and then came back to the Instagram tab.	Expected. A Continue link appears for them to tap.
No OnlyFans clicks showing	Either the daily sync has not run yet, or the tracking code is shared with another page.	Wait for the next overnight refresh. If still nothing, confirm the code is unique to this domain.

7. Glossary

Term	Meaning
Person / Model	The creator herself. She owns all of her domains. Photos and identity are set once on the person and apply everywhere.
Site	One domain. A person with four domains has four sites in CharmLink. This is why you add a domain from the person, not by creating a new creator.
Slug	A site's short internal name. Never seen by visitors when the site has its own domain.
Auto-redirect	A site with no landing page that forwards straight to one link.
Bot cloaking	Serving crawlers a harmless decoy blog instead of the real page. On by default. Leave it on.
Escape	Getting a visitor out of Instagram's built-in browser and into their own browser, where they are already logged in to OnlyFans.
Tracking code	The /c1234 on the end of an OnlyFans link. How OnlyFans tells you which domain sent a subscriber.

Questions about anything in this document should go to whoever maintains CharmLink before you change a live domain.
